I remove features. I don't add them.

That might sound strange for a designer. But after studying task management apps, music players, and websites, I learned something important: *most apps do too much, not too little.*

I am studying computer science at the University of Johannesburg, but my real interest in UI/UX design comes from a simple observation: people get frustrated when software fights them. I started noticing bad tap targets, endless menus, and layouts that ignore how eyes move. That frustration turned into curiosity. Curiosity turned into building my own projects, not to add more features, but to strip things down until only what matters remains.

I want an internship where I can turn research-backed decisions into clean, usable interfaces. Not pretty screens that frustrate users. Real tools that respect attention, thumbs, and scanning patterns.

My Best Projects

Project	Problem	UX Laws	Result
To-Do App	Overwhelming filters and menus before adding a task	Hick's, Fitts's, Gestalt	One-tap add

Project	Problem	UX Laws	Result
Music Player	Tiny buttons when walking or driving	Fitts's, Von Restorff	Larger play button, thumb-reach controls
Website	Dense layouts, no one reads	F Pattern, Z Pattern, Jakob's Law	Content where eyes land first, no popups

What I'm Still Learning

To be honest about my gaps. I want an internship to improve at:

- Usability testing with real people
- Accessibility standards: color contrast, keyboard focus states
- Clean handoff to developers: specs, components, and knowing what to over-communicate

Why This Internship

I want to contribute my minimalist thinking while learning how great design survives development, testing, and real-world users. I want to see how design holds up when engineers ask hard questions, when users get confused, and when deadlines press. I believe that's where good design becomes real design.
